Acknowledgement of Assistance

All manuscripts utilizing data made available through the **Zentralarchiv fuer empirische Sozialforschung** should acknowledge that fact as well as identify the original collectors of the data. We kindly ask all users to follow some adaptation of the following statement:

The data utilized in this (publication) were documented and made available by the **ZENTRALARCHIV FUER EMPIRISCHE SOZIALFORSCHUNG, KOELN**. The data for the 'ISSP' were collected by independent institutions in each country (e.g. the Australian survey was conducted by the NSSS at the Australian National University (J. Kelley, M. Evans, C. Bean)). Neither the original collectors nor the **ZENTRALARCHIV** bear any responsibility for the analyses or interpretation presented here

In order to provide funding agencies with essential information about the use of archival resources, and to facilitate the exchange of information about research activities based on the **ZENTRALARCHIV's** holdings, each user is expected to send two copies of each completed manuscript to the **ZENTRALARCHIV**.

Please note

Remarks on the Structure of the Background Variables

The section of background variables in this documentation starts with variable no. V99. For interpretation and comparison of results the variables in this "demographic"-section must be differentiated by the leading letter of the variable-number which is "V..." or which can be the country abbreviation (e.g. "D...")

Variable-numbers starting with a leading "V..." are coded according to the ISSP Standard:

e.g. **V99 - Sex of Respondent**

Variable-numbers starting with a country-code (e.g. "Dnnn") have a country specific coding scheme. But these variables have the same meaning and can be compared with the standard background variable **Vnnn**.

e.g. **V103 - Education categories** (ISSP standard categories)
D103 - Education categories (with special German categories)
GB103 - Education categories (with special British categories)
etc.

All marginals in this documentation are calculated from

An Introduction to the ISSP

The **International Social Survey Programme (ISSP)** is a voluntary grouping of study teams in eleven nations (soon to become thirteen or fourteen), each of which undertakes to run a short, annual self-completion survey containing an agreed set of questions asked of a probability-based, nation-wide sample of adults. The topics change from year to year by agreement, with a view to replication every five years or so. The questions themselves are developed by subgroups and then thrashed out at an annual meeting attended by representatives of each national team. At the last meeting in May 1989, in London, there were 29 participants from the 11 national teams, including representatives of the **ISSP's** 'official' data archive, the **Zentralarchiv** at the University of Cologne. A constitution of sorts has now been adopted by members of the **ISSP**. It contains, for instance, rules of entry for new members and responsibilities of membership. The primary duty of each member is, of course, to run every annual module (or at least nearly every one) in the agreed format. But there are no central funds for the **ISSP**: each national team covers the costs of its own piloting, fieldwork, data preparation, travel to meetings and so on. Since the **ISSP** has agreed to use one language for drafting and for meetings - (British) English - there are no central translation costs.

Improbable as it may seem, this general formula has worked well so far. The annual questionnaires for instance (contrary to all advice and experience) have actually been designed for the most part in committee, and though inevitably flawed, are no less successful than most. Admittedly, this success owes a lot to careful prior development work by drafting groups and to subsequent adjustments after piloting. In any event, fascinating data are already beginning to emerge.

A fuller treatment than is given here, of the results generated so far by the series, is to be provided in the first **ISSP** Report, a book funded by the European Cultural Foundation and due to be published by the Netherlands **Social and Cultural Planning Bureau (SCP)** in 1990.

As may by now be apparent, the **ISSP** has grown and developed somewhat haphazardly, and this pattern shows every sign of continuing as long as it seems to work. The **ISSP** certainly came into life without much serious planning, having emerged as a vague idea during an impromptu meeting the two of us in 1983 whose purpose was primarily to exchange experiences and explore opportunities for borrowing each other's questions.

At that stage, the **British Social Attitudes Survey (BSAS)** was still in its first year, but had just received news that it was to be given at least a four-year life span through the generosity of the Sainsbury Family Charitable Trusts. The **US General Social Survey (GSS)**, in contrast, was some 12 years old and had already acted as something of a role-model for other national series, including the **BSAS** itself, the **West German Allgemeine Bevoelkerungsumfrage der Sozialwissenschaften (ALLBUS)** (started in 1980) and the **Australian National Social Science Survey (NSSS)** (which was about to take its first fieldwork round).

As is usual at such meetings, we were bemoaning the fact that survey questions are poor travellers, especially across national and cultural boundaries. The **BSAS**, for instance, despite intentions to the contrary, had managed to transplant only one or two questions directly from the **GSS**. The West German **ALLBUS** contained a few more replications as a result of a specific bilateral agreement with the **GSS**. But a long-standing problem for all national time-series of this sort was, and is, that the concern for a year-by-year comparability within a country is often conflict with a concern of comparability between countries. Since funding is almost from national sources, the choice both of topics and of question-wording tends to reflect national rather than cross-national priorities.

So the conclusion we reached in 1983 was that the ideal way of securing a greater element of cross-national comparability should probably be via a standardised bolt-on supplementary questionnaire designed specifically for that purpose. With this in mind, **SCPR** sought and obtained a small grant from the Nuffield Foundation for convening a meeting (and then another) between representatives of the other three national social attitudes surveys which we already had some contact - those in Australia, West Germany, and the USA. There, the idea of a bolt-on, mutually-designed series of supplementary questionnaires could be aired and, perhaps, taken further.

As it turned out, the idea was warmly received by all four groups, who also decided that these supplements should be in a self-completion format, primarily for reasons of cost and to avoid adding to the already long, personal interviews. At the following meeting, the first bolt-on module, on the role of government, was developed and scheduled for fielding in 1985.

It was later translated into American English, Australian English and German to obtain functionally-equivalent rather than identical wordings. Although we were not quite aware of it at the time, the **ISSP** had effectively started. Since then, several other modules have been designed and fielded, the membership has grown threefold, and the structure has become a bit more bureaucratic, but not (yet) unduly so.

Fieldwork Dates:	March to July 1993
Principal Investigators:	Jonathan Kelley, Clive Bean, Mariah Evans
Sample Type:	Panel of respondents from the earlier NSSS 'Family' and 'Lifestyles' surveys, conducted in late 1989 and early 1990 (from which the socio-demographic background variables for the 1993 data are taken). The sample for these two surveys was a nationwide simple random sample covering the whole of Australia, drawn from the (compulsory) Australian federal electoral rolls by the Australian Electoral Commission. Potential respondents were eligible for inclusion in the sample if they had completed the Family or Lifestyle surveys, had not indicated that they did not wish to participate further and were still contactable at the same address. The simple random sampling method means that standard statistical tests are appropriate (i.e., without the downward adjustment of effective sample size appropriate for the clustered sample designs usual in face-to-face interviews).

Study-Title:	Austrian Social Survey 1993 Survey
Fieldwork Dates:	February to March 1993
Principal Investigators:	Prof. Dr. Max Haller, Dr. Franz Hoellinger
Sample Type:	The ISSP 1991 and ISSP 1992 were fielded together with the Austrian Social Survey 1993. The whole sample is divided into two sub-samples which contain at times the one or other ISSP-questionnaire. The sample is a three stage stratified person random sample. The sample-points are selected according to the criteria of region and size of place. Within the household the interviewer has to select the respondent among the household-members over 16 years of age according to a random method.
Fieldwork Institute:	Institute Fessler & GfK, Vienna
Fieldwork Methods:	Face-to-face interview
Context of ISSP questionnaire:	Part of the 'Austrian Social Survey 1993'
Sample Size:	1027
Response Rates:	Not available; probably similar to previous Austrian ISSP-studies
Language:	German
Weighted:	Yes
Weighting procedure:	Weighting corrects the compound dataset of the 'Austrian Social Survey 1993' to the most recent Austrian Mikrocensus data. The weighted ISSP 1991 dataset gives slightly different marginals from the weighted overall dataset. Due to the fieldwork method (face-to-face interviews in private households) the economically active population is considerably underrepresented in the sample.

Study description:	Bulgaria
Study-Title:	ISSP Inequality II Bulgarian Survey 1993
Fieldwork Dates:	March 8, 1993 - March 31, 1993
Principal Investigators:	Lilia Dimova, Institute for Trade Union and Social Research, Sofia; Co-Investigator: Alexander Stoyanov and Todor Kaloyanov, Center for the Study of Democracy, Sofia
Sample Type:	<p>The sampling model used is that of a two-stage cluster sample with a preliminary stratification of the clusters by a technical variable: the number of voters in each electoral section (the electoral sections are those of the last parliamentary elections of October, 1991; total number: 12454). The June 1993 Bulgarian sample contains 175 clusters, each with 9 persons which makes a total of 1575 persons. The clusters and the respondents within the clusters are chosen at random. Each of the interviewers was supplied with a list containing the names and the addresses of the respondents to be interviewed. At the field stage no replacements were allowed. The interviewers were instructed to record the necessary information for all inaccessible respondents.</p>
Fieldwork Methods and Module Context:	<p>The method employed is face-to-face interview. The ISSP questionnaire was organized in 4 sections (A,B,C and D). Sections A and B contain the ISSP Module; section C is supplied by the Bulgarian investigator and accounts for about 30% of the total size of the questionnaire; section D contains all demographic variables. The general impression is that the interview was well accepted, especially by younger respondents. Problems were encountered in the group of older representatives of the Turkish and the Gypsy minorities with a lower educational level.</p>
Sample Size:	1575
Response Rates:	<p>1575 A - Total issued - total sample 81 B - Ineligible 1494 C - Total eligible (in scope sample) 1198 D - Total ISSP questionnaires received 296 E - Total non-response</p>

Missing questionnaires can be grouped according to the various reasons as follows:

81	B	-	new and wrong address
32	F	-	firm refusal to be interviewed
153	G	-	temporary absence (being in hospital, in a business trip etc.)
28	G	-	emigration
43	G	-	non-contacts
6	H	-	military service
34	H	-	dead

377 **Total**

The main reasons for refusals were: principal unwillingness to be interviewed, poor health condition, and age.

As a whole the number of inaccessible respondents did not, in our opinion, affect the representativeness of the real sample.

The average number of interviews per interviewer is 15.

Known systematic properties of the sample:

The above sampling model has been employed in many previous surveys and produces good results. There are no reasons to indicating impacts of non stochastic factors that could produce biased results.

Principal Investigators:	Alan Frizzell, Carleton University, Ottawa																
Sample Type:	A stratified multi-stage sampling method was employed using as the primary strata the five main regions; Atlantic Canada, Quebec, Ontario, Western Canada and British Columbia. Within these regions major sub-areas were randomly selected from Federal Electoral Districts. Within each of these districts two Enumeration Areas were randomly selected. Using Census maps the first two streets that began with the letter G and S and contained more than 50 residential units were then chosen resulting in a total of 64 sampling frames. Interviewers were instructed to divide the number of residences on any given street by the number of sample points required. In-home sampling used the 'first birthday' technique.

Study-Title:	ISSP 1992: Inequality II module - The Hungarian Survey
Fieldwork Dates:	October 1992
Principal Investigator:	Tamas Kolosi, TARKI, Budapest
Sample Type:	Originally 1500 questionnaires were planned to be fielded. The sample was a subsample of the 3000 persons interviewed in Spring 1992 with the TARKI-Mobility questionnaire. In addition to the Inequality module, the questionnaire included a section on the perception elite and some questions on political preferences. We included some items for the NSSS, Australian National University, too. All these questions were placed after the Inequality module. The original sample of 3000 was staged proportional random sample. The first stage of sampling was constituted by the selection of communities, the second stage was the selection of individuals. The sample consisted of 2x1500 respondents and both of these subsamples were expected to be representative regarding the sex, age and regional distribution of Hungarian population. Because the sample of the Inequality Module was a subsample of the Mobility survey, we were not able to use supplementary addresses so the planned sample was reduced to N=1250.
Fieldwork Institute:	TARKI, Budapest
Fieldwork Methods:	Personal interviews
Sample Size:	1250
Response Rates:	Most frequent causes of unsuccessful attempts to conduct the interviews (N=250):

In proportion of all failed interviews

R was unable to answer (e.g. ill, drunken)	10.5 %
Refusal	42.7 %
Temporarily far from home	14.1 %
Address has changed	4.8 %
Address was wrong	0.8 %
R died since Sprint of 1992 cannot be found at home by three times a visit	18.2 %
Other reasons	6.9 %
Total	100.0 %

The proportion of dropouts was 16.6 % of the original sample of 1500 resulting a final N=1250. The most frequented reasons of unsuccessful attempts to re-interview was the refusing of interview. This failure was more typical in Budapest, in the case of men, for middle-aged (30-39) and very old (70-X) respondents. Therefore these socio-demographic categories are underrepresented in our sample compared with the sample of 2 % of Census of 1990, (the most recent one for the Hungarian population).

Weighted: Yes

Weighting procedure: In order to correct the sampling error we computed a weighting variable taking into account the type of residence, sex, age and highest educational level. The weight of each cases was computed as $WEIGHT = (n/n') * (N'/N)$, where $N=153553$ (respondent above the age of 18 in the 2 % sample of the 1990 census), $N'=1250$, n =frequency of the population category in the census subsample the case belongs to, n' =the parallel frequency in the Inequality Module of TARKI.

Fieldwork Dates:	August to September 1992																		
Principal Investigators:	P. Gendall, Massey University, Palmerston North, New Zealand																		
Sample Type:	The sample was selected using the 1990 New Zealand electoral rolls which contain the names of all registered voters over the age of 18 years. New Zealand is divided into 97 electorates of approximately equal size. A systematic random sample was taken from each electorate. There were no age or sex quotas and, because the electoral rolls were used, the sample reflects the distribution of the population over 20 years of age (the electoral roll was two years old in 1992).

Comments on labour force status and education

The NSD data are compared with data from the Norwegian Labour Force Surveys (LFS). The LFS are conducted every month with a gross sample of about 10000 persons aged 16-74 years. The aim of the LFS is to watch the development in the labour market and to estimate the composition of the population with respect to labour force participation and main activity. In the LFS members of the labour force are defined as people

1. who have some sort of paid work or are drafted in military service (the questions tapping this aspect are identical in the LFS and the NSD surveys);
2. who work in family business;
3. who are temporarily out of work (e.g. sick, laid off).

From the NSD background variable questions we are able to construct a labour force status variable which is a good comparison with the LFS data. There might be a small uncertainty about people who are temporarily out of work and for some reason answer that they don't have paid work. Since the Central Bureau of Statistics uses a combination of telephone and personal interviewing in the LFS, we also believe that the Central Bureau achieves relative higher response rates among marginal social groups.

The construction of comparable education variables is more uncertain, and the data should be interpreted with great care. Only the number of people with education at university level is comparable.

Study-Title:	Social Inequality in the Philippines: the 1992 ISSP Survey
Fieldwork Dates:	November 15 to December 15, 1992
Principal Investigator:	Social Weather Stations, Inc. (SWS)
Sample Type:	Multi-stage probability sample. The survey had 1200 adult respondents (18 years and above or the voting population), with sampling quotas of 300 for each of the four major areas: Metro Manila, Balance Luzon (areas within Luzon but outside Metro Manila), Visayas and Mindanao. Respondents of the latter three major areas were further subdivided into 150 urban and 150 rural respondents. The number of respondents is always realized. The survey has two types of respondents: the household head, who answered all questions pertaining to the household, and the adult respondent, not necessarily the household head, who answered the rest of the questions. The ISSP questions were answered by the adult respondent.
Fieldwork Institute:	Social Weather Stations, Inc. (SWS)
Fieldwork Methods:	Face-to-face interview.
Context of ISSP questionnaire:	Part of a national study

Weighting Procedure:	To come up with total Philippine figures, appropriate weights, based on the National Statistics Office's (NSO) 1980 projections for the year 1985, were applied. The use of these weights made the ISSP Social Inequality module results comparable with regular SWS surveys. The obtained weights are given below.

The allocation of sample units in each stage is as follows:

Study Description:	Poland
Study-Title:	PGSS 1992: Social Inequality II (Poglady Polakow 1992)
Principal Investigators:	Bogdan Czichomski, University of Warszawa
Sample Type:	<p>The sample used in the PGSS-92 study was a multilevel random area sample selected from the sampling frame of the Central Statistical Office. Households were selected for the sample using the procedure described below. Among the residents of each of the households the interviewer selected one person as the respondent. The procedure for selecting households had several stages. In the first phase the territory of the country was divided into strata. Each city with a population over 100 thous. residents constituted a stratum (a total of 43 cities), and for the five largest cities their districts were strata. For the other cities strata were formed by grouping cities according to a number of inhabitants. For rural areas 8 regions were distinguished based on the division of the Central Statistical Office. In sum the territory of Poland was divided in an exclusive and exhaustive way into 77 strata. These strata were than divided into three groups: metropolitan, urban and rural. Simple random sampling without replacement was used for metropolitan strata. For urban strata a two stage selection scheme was used. The sampling for rural strata was conducted in three stages. In the third phase a number of households was randomly selected so that the number of households drawn in the stratum would be proportional to the size of the stratum. The result of the above described procedure for selection of households was a collection of 2000 addresses of households. Among the residents of each of the households the interviewer selected one person aged 18 years and more using random numbers.</p>
Fieldwork Methods:	<p>The background data were collected through personal interviewing, the ISSP Module was conducted as a self-administered separate questionnaire, filled in by respondent him/herself after completing the interview and then returned to the interviewer.</p>

Weighting Procedure: The probabilities of selection are inverely proportional to the number of adults in individual household. This bias may be partially corrected by weighting the results by the number of adults in individual households. This is standard procedure in studies using area sampling method. In addition, in the PGSS study post-stratification weighting is used. This method serves to adapt the structure of the sample completed to the structure of the population in respect to basic social and demographic characteristics. The following social and demographic characteristics were considered: sex, age (divided into three categories: 18-19 years old, 30-49 and over 50) and the division of the place of residence into urban and rural.

Study-Title:	ISSP 1992: Inequality II module
Fieldwork Dates:	February 26 to March 19, 1992
Principal Investigator:	Dr. Ludmilla Khakhulina
Sample Type:	<p>The sample was made on the following basis: At the first stage the regional departments were selected. On the second stage the settlements were selected in the territorial areas of these departments. On the third stage the respondents living in these settlements were selected. At the first and second stages procedures of controlled random drawing were used: on the first stage this was a random sample drawing, and on the second with probability proportional to the size of settlements. On the third stage the procedure of controlled random selection was used from the address bureaus, lists of electorate and lists of inhabitants in rural settlements. At the first two stages the sample was drawn on the basis of data on the size of the population and structure of settlements in the territorial zones of the regional departments, at the third, on the basis of data of the structure of the population by sex and age. The number of interviews to be conducted was divided between regions proportional to the share of inhabitants in these regions to the total population of the chosen regions. The number of respondents in each regional department was divided between urban and rural settlements in proportion to their share in the region. At the next step the number of target persons for the urban population in the region was divided between the regional centres, towns at the periphery and Moscow. After this the controlled variables of the structure of population by sex and age were defined, and then the controlled systemic random sample was drawn on the last stage of the sample. In the regional departments the banks of potential respondents were chosen using the procedure of preliminary systemic selection of respondents on the basis of lists of address bureaus, lists of the electorate, lists of workers at collective farms and sovkhoses. After the addresses had been selected and the controlled quotas checked, they were given to interviewers for them to interview the potential respondents at their places of residence. Interviews were attempted with persons 16+ years of age. The planned urban respondents were 1477, rural 527. The interviews were conducted in 42 settlements: 12 rural settlements, 13 cities at the periphery, 17 central cities (centres of oblast, autonomies), Moscow and Sanct-Petersburg.</p>

Language:	Russian
Weighted:	Yes
Weighting procedure:	Besides the criteria of sex and age, some other socio-demographic characteristics of the sample, first of all the distribution of respondents by education, differentiated substantially in several regions. That is why the main aim of weighting was to correct the data in respect of education, while preserving very good distribution by sex and age and distribution by types of settlements. Using official statistical data about gender, age, type of settlement, education, we estimated a sampling rate for each region, and than conducted post-stratification weighting basing on these coefficients.

Study-Title:	Slovensko Javno Mnenje (SJM - Slovenian Public Opinion)
Fieldwork Dates:	February 1992
Principal Investigator:	Niko Tos, Janez Stebe; Public Opinion and Mass Communication Research Centre, University of Ljubljana
Sample Type:	The survey is a representative probability survey of the residential population conducted regularly from 1968. As a sampling method it is used a systematic multi-stage sampling of adults aged 18 to 70 years. It is an EPSEM sample of persons. Based on a central register of citizens at first stage equally distant points (persons) are selected. At second stage two more points were drawn by steps to the left and to the right from the first point. Finally clusters of five persons are formed around points on register from the previous stage.

Study Description:	Sweden
Study-Title:	Attitudes to Inequality - a Swedish Survey 1991
Fieldwork Dates:	February to April 1991
Fieldwork Institute:	Statistics, Sweden
Principal Investigators:	Stefan Svallfors, University of Umea
Sample Type:	A representative sample of Swedish population 18-74 years.
Fieldwork Methods:	Separate postal survey with two reminders by post to all non-respondents and a telephone interview follow-up on a sub-sample of remaining non-respondents
Sample Size:	749
Response Rates:	1498 A - Total issued - total sample 45 B - Emigrated, living in institutions, unknown address 1453 C - (= A - B) Total eligible (in scope sample) 915 D - Total ISSP questionnaires received (weighted) 701 by mail 214 by telephone 538 E - Non-responses 215 F - Refusals 323 G - Non-contact
Language	Swedish
Weighted	Yes
Weighting Procedure:	A subsample was drawn among those who had still not responded after two subsequent reminders. 50% of them were selected for telephone interviewing, following the normal practices of Statistics Sweden. All respondents in the subsample has accordingly been given the weight 2 in the systemfile. However, in order to keep the representativeness of the sample, all calculations should be made using the weight.

Study Description:	USA
Study-Title:	General Social Survey 1992 (GSS)
Fieldwork Dates:	February to April, 1992
Principal Investigators:	James A. Davis, Tom Smith, NORC
Sample Type:	Three-stage NORC Master Sampling: Full Probability Sample
Fieldwork Institute:	National Opinion Research Center, University of Chicago, NORC
Fieldwork Methods:	In 1992 NORC attempted to locate and reinterview all 1517 respondents to the 1991 GSS. 1041 were reinterviewed by mail and 232 by telephone.
Context of ISSP questionnaire:	The ISSP data are part of the GSS
Sample Size:	1273 achieved
Response Rates:	In 1992 NORC attempted to locate and reinterview all 1517 respondents to the 1991 GSS. Interviews were completed with 84 % or 1273 of the 1991 GSS respondents. Of the 244 nonrespondents 115 could not be located, 100 refused, 20 were unable to respond for other reasons (e.g. physically or mentally incapable of answering questions), 8 were deceased, and 1 was unavailable.
Language:	American English
Weighted:	Yes
Weighting procedure:	To adjust for the differential response a weighting variable was created based on education and family income. This weight compensates for the underrepresentation of the less educated and lower income respondents in the 1992 reinterview. While this weight does not seem to change results very much, researchers should consider using it to help make the 1992 reinterview a representative sample of the US adult population.

Explanations

<1> A variable (and reference) number have been assigned to each item in the study. In the present codebook which documents the archived data set, these numbers are identical. Should the data set be subsetted or rearranged the variable numbers might change to reflect the order of the new data set while the reference numbers would remain unchanged to provide a link to the archived data set.

<2> Indicates the abbreviated (24 character maximum) variable label used within OSIRIS or SPSS system files.

<3> "Location" indicates the starting position of the variable when the dataset is stored in the OSIRIS format. "Width" describes the number of positions of the variable.

<4> "MD" indicates the designation of the missing data. MD1 indicates an explicit defined single value. MD2 designates a single value or a value range, i.e. all values equal or greater than this value have been declared missing. Although these categories are defined as missing data categories, this does not mean that the user should not or cannot use these codes if so desired.

<5> If a variable contains implied decimals, the message "Dec.places: xx" appears here, where xx is the number of decimal places.

<6> Indicates the full question text taken from the British questionnaire. Wherever possible the original sequence of questions has been retained, although some changes were necessary to integrate the different national questionnaires.

<7> Indicates commentaries and explanations added during the processing of the study. < within question or answer texts may indicate whether the questionnaire in a particular country is deviating from the general format.

<8> Indicates the code value for the single answer category.

<9> Indicates the textual definition of the codes. Abbreviations commonly used are DK (don't know), NA (no answer), Can't choose, Not applicable and Not available.

<10> Indicates percentaged frequencies by country. This form is used whenever code categories have the same meaning for all countries. Column percentages are based only on "valid cases". Missing data values were excluded from percentages.

Standard occupation classification unit groups within minor groups.

Source: In 1991 OPCS introduced a new occupation coding schema, the Standard Occupational Classification (SOC). "Occupations are viewed in SOC as coherent sets of work activities carried on by individuals. In defining occupational groups, the aim has been to distinguish as far as possible in terms of the type and level of skills required to carry out the main work activities" (OPCS, 1991b, p.2).

Note 0005

This Note refers to V127 and V128 and contains specific explanations about size and type of the place of residence.

Germany

The political size of community (V127) contains classified details of size about places of residence for each of the respondents. Unclassified data are not available for reasons of data protection.

The starting point for these details of size is the size of the communities as political administrative units.

Political administrative units often describe incompletely the type of community where the respondent lives. To adjust the regional statistic to the requirements of a spatially relevant and ecologically based structural analysis, the variable 'Boustedt - classification of the size of communities' (V127) was integrated in addition to the size of the political administrative units. The real type of settlement in the surrounding place of residence is decisive for the classification, independent of the political administrative units.

United States**NORC size of place****Source: GSS Methodological Report No.4.****Within an SMSA and --**

- 01 A large central city (over 250.000)
- 02 A medium size central city (50.000 to 250.000)
- 03 A suburb of a large central city (a)
- 04 A suburb of a medium size central city
- 05 An unincorporated area of a large central city
(division, township, etc.)
- 06 An unincorporated area of a medium central city

Not within an SMSA, (within a country) and --

- 07 A small city (10.000 to 49.999) (b)
- 08 A town or village (2.500 to 9.999)
- 09 An incorporated area less than 2.500 or an
unincorporated area of 1.000 to 2.499 (c)
- 10 Open country within larger civil divisions, e.g.
township, division

Remarks:

- (a) A suburb is defined as any incorporated area or unincorporated area of 1.000+ (or listed as such in the U.S. Census PC (1)-A books) within the boundaries of an SMSA but not within the limits of a central city of the SMSA. Some SMSAs have more than one central city, e.g., Minneapolis-St. Paul. In these cases, both cities are coded as central cities.
- (b) If such an instance were to arise, a city of 50.000 or over which is not part of an SMSA would be coded '07'.
- (c) Unincorporated areas of over 2.499 are treated as incorporated areas of the same size. Unincorporated areas under 1.000 are not listed by the Census and are treated here as part of the next larger civil division, usually the township.
